HOW TO PREVENT TAILGATING AND COLLUSION

HERE ARE 5 WAYS TO IMPROVE YOUR ENTRANCE SECURITY

1.) INTELLIGENT TURNSTILES

Intelligent turnstiles make thousands of calculations per second in order to detect tailgating as close as 5mm, whilst also avoiding false alarms. They can even detect luggage and react (or not react) accordingly.

2.) DETECT PASSBACKS

Door Detective provides an additional layer of security to prevent collusion through internal restricted access doorways. It uses multiple infrared beams to monitor movement in both directions therefore enforcing the one card/one person rule.
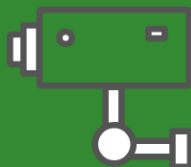

3.) ENTRANCE CONTROL MONITORING & MANAGEMENT

Monitor and analyse your entrance control operations. This will allow you to identify any security breaches and flag up any unauthorised access attempts. Our Fastlane Connect web based portal is a great way to monitor your security from any location.

4.) BIOMETRIC SECURITY

Early biometric security controls were clunky and could occasionally be inconvenient for the user. However, biometric systems have vastly improved and are now a viable security method. Our latest product integration, the Glassgate 400 with MorphoWave™ Compact, allows authorised users to gain access with a simple wave of the hand.

5.) INTEGRATE ACCESS CONTROL WITH CCTV

Integrating other security systems, such as CCTV, allows for easier identification of potential intruders.
